Professional Summary

Senior Software Engineer with ~9 years of experience designing and building scalable distributed systems, cloud-native architectures, and high-reliability backend platforms.

Specialized in Java (Spring Boot) microservices, AWS infrastructure, event-driven systems, and data processing pipelines. Strong experience integrating APIs, financial systems, and healthcare data. Comfortable working across the entire stack, from backend architecture to frontend applications and mobile integrations.

Beyond professional experience, I founded and operate **V30**, a self-hosted portfolio of independent SaaS products (health-tech, real estate, nutrition, faith and link-in-bio apps) that I design, build, and run end-to-end — Go and Java backends, Angular/Next.js frontends, Flutter mobile apps, and an internal AI-gateway service unifying OpenAI, Anthropic, and Gemini. Flagship product: **DiaBuddy**, a diabetes management platform that integrates real-time glucose monitoring data, analytics, and predictive algorithms.

I administer the Linux VPS that hosts all of it myself — Docker Compose deployments behind a Caddy reverse proxy with automatic HTTPS, GitHub Actions CI/CD, multi-schema shared databases, and a self-configured observability stack (Prometheus, Loki, Promtail).

Strong focus on:

- Performance
- Observability
- Clean architecture
- Testability
- Product thinking (not only coding)

I actively design systems considering scalability, resilience, and maintainability.

Core Competencies

Backend & Architecture

- Java 17/21, Spring Boot, Spring Data, Spring Security
- Go (Gin, GORM) — production microservices and REST APIs
- REST APIs, BFF pattern
- LLM/API integrations: ChatGPT (OpenAI), Anthropic (Claude), and Google Gemini (built an internal Go gateway service unifying all three)
- Payment & subscription integrations: Mercado Pago checkout/webhooks, Apple App Store and Google Play in-app purchase verification
- Microservices and modular monoliths
- Event-driven architecture
- Transaction management (@Transactional, propagation, consistency)
- Domain-Driven Design (DDD)
- Integration systems and data processing pipelines
- Batch processing and asynchronous workflows

Cloud & DevOps

- AWS (S3, SQS, Lambda, Step Functions, EC2, EKS)
- Docker and Kubernetes (EKS)
- Linux VPS administration for a multi-service containerized platform (Go, Java, Python, Angular, Next.js), including self-configured end-to-end observability
- Caddy reverse proxy with automatic TLS (Let's Encrypt); GitHub Actions deploy pipelines
- S3-compatible object storage (AWS S3, DigitalOcean Spaces) and Azure Blob Storage
- CI/CD (GitLab CI, GitHub Actions)
- Infrastructure troubleshooting in production
- Observability and logging (Splunk, centralized logs, self-hosted Prometheus/Loki/Promtail stack)
- LocalStack, TestContainers

Databases & Data

- PostgreSQL, MySQL
- SQL performance tuning
- Liquibase and Flyway migrations
- Multi-schema database strategies (single RDS cluster shared across multiple products, isolated per schema)
- Data ingestion pipelines

Frontend & Other Languages

- TypeScript / JavaScript
- Angular (incl. Angular 22 standalone), Next.js / React
- Flutter / Dart — shipped multiple iOS & Android apps
- Python (FastAPI, automation, lambdas)
- C#

Testing & Quality

- Unit tests (JUnit)
- Frontend testing (Karma, Jasmine)
- Integration testing
- Test coverage culture
- CI quality gates

Personal Projects (Selected)

V30 - Self-Hosted SaaS Product Suite

Founder & Software Architect

I design, build, and operate a portfolio of independent SaaS products end-to-end — backend, frontend, and mobile — all self-hosted on a Linux VPS I administer myself, behind a shared Caddy reverse proxy with automatic HTTPS and a centralized Prometheus/Loki/Promtail observability stack.

DiaBuddy — Diabetes Management Platform (flagship product)

A health-tech platform to help people with diabetes manage their daily treatment.

- Continuous Glucose Monitoring (CGM) integrations (Nightscout ecosystem)
- Carbohydrate counting using AI image analysis
- Insulin dose assistance calculations (ICR, ISF/ICF, IOB/COB)
- Predictive glucose analytics
- Flutter mobile app + FastAPI backend + PostgreSQL, real-time data ingestion pipelines

Other products in the suite:

- **Genesis** — subscription-based Bible/devotional app (Flutter, Go/Gin backend); Google Sign-In auth; Apple App Store and Google Play in-app purchase verification
- **Imóveis V30** — real estate management platform: public listing site and admin panel (Angular), realtor mobile app (Flutter), and Go/Gin + GORM APIs; Mercado Pago subscription billing
- **Links** — link-in-bio SaaS with analytics and WhatsApp-ready Open Graph previews (Angular 22, Spring Boot 3.4 / Java 21, S3-compatible storage, Mercado Pago billing)
- **MeuNutriFit** — nutrition tracking app (Flutter + Angular, FastAPI backend) with AI-based meal-photo analysis and PDF report generation
- **Vitrine Corporativo** — dynamic corporate website builder (Next.js frontend, Go backend, Azure Blob + AWS S3 storage)
- **ia-service** — internal Go microservice gateway unifying OpenAI, Anthropic, and Gemini APIs (text and image generation) for use across every product above

Infrastructure I designed and maintain: multi-schema PostgreSQL/MySQL databases shared across products, Docker Compose deployments, GitHub Actions CI/CD, and the observability stack described above.

This project demonstrates product ownership, architecture design, and end-to-end system development across seven independent products and five languages/runtimes, beyond enterprise environments.

Professional Experience

Orla.tech - ANBIMA

Senior Backend Software Developer

Jul 2025 - Present

- Acting at ANBIMA, one of the largest financial institutions in Brazil
- Led a 3-developer team to build a file-processing architecture from scratch between Jul 2025 and Dec 2025
- Defined and led the technical architecture using Java, AWS, Java Lambdas, Step Functions, S3, SQS, RDS, and Kubernetes
- Led product understanding with stakeholders and translated complex requirements into clear implementation plans for the team
- Simplified complex technical decisions and enabled faster delivery across the squad

SPASSU - Brazilian Superior Court of Justice (STJ)

Senior Full Stack Software Developer

Apr 2024 - Jul 2025

- Designed and implemented backend features using Java and TypeScript
- Improved maintainability by refactoring legacy components
- Implemented full automated testing coverage for new modules
- Collaborated directly with stakeholders to translate legal requirements into software systems

NTTDATA - Itau Bank

Senior Backend Software Developer

Aug 2021 - Apr 2024

- Built backend services in Java and Python for financial and agribusiness operations
- Developed AWS Lambda functions reducing operational costs
- Improved production observability through better logging and Splunk analysis
- Mentored junior developers and reinforced testing culture
- Worked with distributed systems and asynchronous processing

Betha Sistemas

Mid-level Full Stack Software Developer

Jul 2018 - Aug 2021

- Developed public management systems using Java and JavaScript
- Built and published a mobile app from scratch (Ionic)

- Deployed and monitored applications in Kubernetes environments
- Participated in production incident analysis and stability improvements

Sistema Info

Junior Full Stack Software Developer

Oct 2017 - Jul 2018

- Implemented logistics system features in C# and JavaScript
- Introduced unit testing practices into the team

Damyller

Desktop Software Developer and IT Support

May 2016 - Oct 2017

- Automated internal processes with C# desktop applications
- Built integrations between SQL databases and SAP systems
- Monitored company workstations and ensured operational stability
- Installed and updated software across user machines
- Provided user support via phone, chat, and an internal help desk tool

Education

Bachelor's Degree in Information Systems

ESUCRI - 2015-2019

Certifications

- AWS Certified Cloud Practitioner (2022)

Languages

- Portuguese: Native
- English: Fluent
