Professional Summary

Senior Software Engineer with ~9 years of experience designing and building scalable distributed systems, cloud-native architectures, and high-reliability backend platforms.

Specialized in Java (Spring Boot) microservices, AWS infrastructure, event-driven systems, and data processing pipelines. Strong experience integrating APIs, financial systems, and healthcare data. Comfortable working across the entire stack, from backend architecture to frontend applications and mobile integrations.

Beyond professional experience, I architect and develop personal SaaS products in the health-tech space, including DiaBuddy, a diabetes management platform that integrates real-time glucose monitoring data, analytics, and predictive algorithms.

Today, I also manage a Linux VPS running containerized workloads across Go, Python, and Angular services, including the full observability setup that I designed and configured myself.

Strong focus on:

- Performance
- Observability
- Clean architecture
- Testability
- Product thinking (not only coding)

I actively design systems considering scalability, resilience, and maintainability.

Core Competencies

Backend & Architecture

- Java 17/21, Spring Boot, Spring Data, Spring Security
- REST APIs, BFF pattern

- LLM/API integrations: ChatGPT (OpenAI), Anthropic (Claude), and Google Gemini
- Microservices and modular monoliths
- Event-driven architecture
- Transaction management (@Transactional, propagation, consistency)
- Domain-Driven Design (DDD)
- Integration systems and data processing pipelines
- Batch processing and asynchronous workflows

Cloud & DevOps

- AWS (S3, SQS, Lambda, Step Functions, EC2, EKS)
- Docker and Kubernetes (EKS)
- Linux VPS administration for containerized services (Go, Python, Angular), including self-configured end-to-end observability
- CI/CD (GitLab CI, GitHub Actions)
- Infrastructure troubleshooting in production
- Observability and logging (Splunk, centralized logs)
- LocalStack, TestContainers

Databases & Data

- PostgreSQL
- SQL performance tuning
- Liquibase migrations
- Multi-schema database strategies
- Data ingestion pipelines

Frontend & Other Languages

- TypeScript / JavaScript
- Angular
- Python (FastAPI, automation, lambdas)
- C#

Testing & Quality

- Unit tests (JUnit)
- Frontend testing (Karma, Jasmine)
- Integration testing
- Test coverage culture
- CI quality gates

Personal Projects (Selected)

DiaBuddy - Diabetes Management Platform

Founder & Software Architect

A health-tech SaaS platform designed to help people with diabetes manage their daily treatment.

Key features:

- Continuous Glucose Monitoring (CGM) integrations (Nightscout ecosystem)
- Carbohydrate counting using AI image analysis
- Insulin dose assistance calculations (ICR, ISF/ICF, IOB/COB)
- Predictive glucose analytics
- Mobile-friendly PWA and Android collector app
- Cloud backend with analytics and data storage

Technical highlights:

- Angular frontend + FastAPI backend
- PostgreSQL database
- AI-assisted food recognition
- Health data processing pipelines
- Real-time data ingestion

This project demonstrates product ownership, architecture design, and end-to-end system development beyond enterprise environments.

Professional Experience

SPASSU - Brazilian Superior Court of Justice (STJ)

Senior Full Stack Software Developer

Apr 2024 - Present

- Designed and implemented backend features using Java and TypeScript
- Improved maintainability by refactoring legacy components
- Implemented full automated testing coverage for new modules
- Collaborated directly with stakeholders to translate legal requirements into software systems

NTTDATA - Itau Bank

Senior Backend Software Developer

Aug 2021 - Apr 2024

- Built backend services in Java and Python for financial and agribusiness operations
- Developed AWS Lambda functions reducing operational costs
- Improved production observability through better logging and Splunk analysis
- Mentored junior developers and reinforced testing culture
- Worked with distributed systems and asynchronous processing

Betha Sistemas

Mid-level Full Stack Software Developer

Jul 2018 - Aug 2021

- Developed public management systems using Java and JavaScript
- Built and published a mobile app from scratch (Ionic)
- Deployed and monitored applications in Kubernetes environments
- Participated in production incident analysis and stability improvements

Sistema Info

Junior Full Stack Software Developer

Oct 2017 - Jul 2018

- Implemented logistics system features in C# and JavaScript
- Introduced unit testing practices into the team

Damyler

Desktop Software Developer and IT Support

May 2016 - Oct 2017

- Automated internal processes with C# desktop applications
- Built integrations between SQL databases and SAP systems
- Monitored company workstations and ensured operational stability
- Installed and updated software across user machines
- Provided user support via phone, chat, and an internal help desk tool

Education

Bachelor's Degree in Information Systems

ESUCRI - 2015-2019

Certifications

- AWS Certified Cloud Practitioner (2022)

Languages

- Portuguese: Native
- English: Fluent
